Subject: Beavers and Manor House Road

I lived off of Manor House Rd. for 16 years and although we had occasional road flooding in the area of the bridge it was never bad until the bridge was replaced. After making several calls over the years the reasons for the flooding have changed. Originally it was stated that the county lowered the elevation of the bridge and it was a county problem. It was recently stated that it was because of the beaver dam. This dam has been there for longer than there was flooding. There has to be a way to address the flooding issue without killing the wildlife that calls our lake home. We are a community that is about preserving the lake hence the reasons for installing the sewers. Why would we kill the wildlife in our lake. Is there not another solution to the flooding. Why can't the elevation of the road be raised six inches? Beaver traps are very cruel the beaver swims underwater and bites on to a piece of birch, their favorite treat, and they then are clamped while still attached to the wood and they drown after struggling for their lives. I can't believe with the taxes I pay that the township can't fix this problem through an engineering standpoint.

Please inform me what you intend to do, I will be attending the township meetings

Sincerely,

Glenn E. Miller
